

I am against Broadband over Power Line technology. This technology is clearly the highest form of noise pollution of the High Frequency spectrum which will render other existing services for radio communications useless. The current services for Broadband are sufficient for the requirements of the consumer and related commercial applications. The BPL will not be effective for broadband applications because deployment will not be accepted by the consumer. The limited deployment will only serve to interfere with existing radio applications in the frequency spectrum from 1 Mhz to 80 Mhz. BPL is an extremely bad concept and should not be deployed.
